# EXECUTIVE SUMMARY REPORT

## Belleville Middle/High School

7/14/2017

---

### What's New?

The roof is on the addition and the new concrete slab has been poured! Soon the interior of the addition will be able to take its shape as it allows for the new bathroom walls and shop walls to be put in place. Both the secure entry and new conference areas have been moving right along as our carpenters look forward to installing the new cabinetry in those areas next week! Our masons are ready to begin laying the new brick veneer on the addition which will really give the school its new look in the coming weeks. Site work is well underway on both the connector roads and Hayden Drive as they are currently being prepared to receive the new asphalt. Stay tuned in for the next couple weeks as many exciting interior and exterior changes will take place!

### The Past Week

- Poured concrete slab for the new addition
- Finished installing joists and decking on the new addition
- Completed installing roof on new addition
- Continued surface prep on connections and Hayden Dr.
- Began taping drywall in conference and secure entry
- Applied spray foam insulation on exterior CMU walls

### Coming Up in the Week Ahead

- Pour and form stairs on new front entry
- Continue taping/mudding in conference and secure entry
- Install casework in conference and secure entry areas
- Lay new brick veneer on addition
- Begin laying non-load bearing walls and steel stud walls in the new addition

*Shown above is a picture of the pump truck which is being used to pump concrete into the school. Here it is being used to help pour the slab in the new addition!*

### Did you know?

Concrete is used twice as much as any other building material in construction and during the construction of the Hoover Dam, 3,250,000 cubic yards of concrete were used. This would be enough concrete to build a two-lane highway stretching nearly 3,000 miles!

*Shown above is what is called a pulverizer, which pulls up the existing asphalt on roads and crushes it so it can be used as a base to be laid back down on the new road!*

*The picture to the left shows the drywall that sits ready to receive taping/mudding and soon paint will follow!*

*Shown to the right is a picture of the freshly poured slab on the new addition. Soon the walls will be put up and the floor will be polished!*
